Font Experiments — Title Styles

GEORGIA BOLD

Introduction to Treasury Management

Serif, editorial feel. Classic and trustworthy. Great for academic/formal docs.

TIMES NEW ROMAN BOLD

Introduction to Treasury Management

Old-school serif. High authority, dense. Works well with colour for contrast.

TREBUCHET MS BOLD

Introduction to Treasury Management

Humanist sans-serif. Friendly but professional. Reads well at all sizes.

VERDANA BOLD

Introduction to Treasury Management

Wide, open letterforms. Excellent legibility. Designed for screens, works in print.

IMPACT

Introduction to Treasury Management

Condensed, punchy. High energy. Best for short titles or marketing callouts.

CANDARA BOLD

Introduction to Treasury Management

Humanist geometry. Modern and warm. Pairs well with Calibri body text.

CORBEL BOLD

Introduction to Treasury Management

Clean, slightly condensed sans. Contemporary. Good for section headers.

CALIBRI BOLD (CURRENT)

Introduction to Treasury Management

Your current default. Clean, Microsoft-native. Familiar but a little plain at title size.

Maths — Equation Styles

Economic Order Quantity (EOQ)

$$EOQ = \sqrt{(2ac \div h)}$$

The order size that minimises total inventory cost by balancing ordering costs against holding costs.

Where:

a = annual demand in units

c = cost of placing one order (fixed)

h = holding cost per unit per year

Worked Example — Zambeef Ltd

Annual demand (a) = 1,000 × 12 = 12,000 units

$$EOQ = \sqrt{(2 \times 30 \times 12{,}000 \div 2.88)}$$

$$EOQ = \sqrt{(720{,}000 \div 2.88)} = \sqrt{250{,}000}$$

EOQ = 500 units

Cost of Not Taking a Cash Discount

$$\text{Discount Cost} = [\, D \div (100 - D) \,] \times [\, 365 \div (N - T) \,]$$

Calculates the annualised cost of forgoing an early payment discount — compare against your borrowing rate.

Where:

- D = discount percentage offered (e.g. 2 for a 2% discount)
- N = net payment period in days (e.g. 30)
- T = discount period in days (e.g. 10)

Example — Terms: 2/10 net 30

$$= [\, 2 \div (100 - 2) \,] \times [\, 365 \div (30 - 10) \,]$$

$$= 0.0204 \times 18.25$$

= 37.2% annualised cost

Since your borrowing rate (8%) is lower than 37.2%, you should borrow and take the discount.

Cash Conversion Cycle (CCC)

$$CCC = \text{Days Inventory} + \text{Days Receivables} - \text{Days Payables}$$

The number of days between paying for inputs and receiving cash from sales. Shorter = better cash flow.
