Hiring Team

KoBold Metals · Zambia

Dear Hiring Team,

Twelve months inside Kansanshi Mining Plc — First Quantum's copper operation in Solwezi — taught me something that most software engineers never see: how a large mining organisation actually handles data. What flows well, where manual bottlenecks form, and where a better-designed system would directly change the decisions geologists and operations teams make. That ground-level exposure is what draws me to KoBold's Data Systems Engineering role, and it is what I believe I bring that most applicants do not.

On the technical side, I build Python pipelines. At Booklessss, an edtech startup I founded, I designed and implemented a fully automated content pipeline from scratch — raw source material in, structured publication-ready output out, with AI language models integrated at the processing layer. Every part of that system — ingest, transformation, asset resolution, output routing — I designed, built, and continue to operate alone. The domain is different from mineral exploration data, but the challenge is identical to what your team works on: making unstructured, inconsistently formatted source material accessible to both humans and machines.

I am based in Kitwe, on the Copperbelt — available for interviews, technical sessions, and any field visit component the role requires. I would welcome the chance to speak with your team.

Yours sincerely,

Dikhilani Mvula
